

TRUSTED INFORMATION

# ONLY hVAD<sup>®</sup> System

for TRUSTED  
INFORMATION

Real-time, non-invasive  
waveforms provide accurate,  
reliable information.

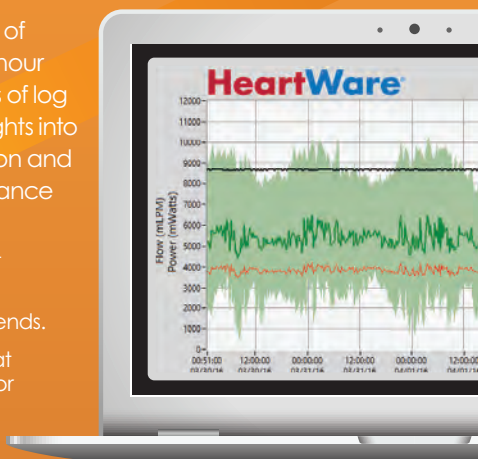

HeartWare<sup>®</sup>

## Real-time data for enhanced patient management

- The HVAD® System offers real-time waveforms during clinic checkups, providing an accurate representation of the relationship between the patient and the pump.
- The system allows for non-invasive patient monitoring, showing visible beat-to-beat dynamic pulsatility changes correlating directly with the patient's hemodynamics.
- HVAD waveforms offer consistent flow accuracy based on the patient's own hematocrit, so clinicians can be confident in their decisions.

## Increased visibility leads to actionable insights

- An early warning system with precise wattage parameters and customizable alarms for each patient.
- HeartWare® log files offer clinicians up to a 30-day historical view—including pulsatility—to better understand clinical trends.
- A HeartWare® team of experts provides 24-hour support and analysis of log files, uncovering insights into the patient's condition and equipment performance to help:
  - Troubleshoot patient complications.
  - Assess equipment trends.
  - Identify user error that may signal a need for additional training.
